Thanks! That creates a PDF on the desktop that can easy be converted to a JPG.

...and if you want to just copy a selected area, use Apple-Shift-4 😊

*"I always knew that there was something out there that I needed to get to.
 And it wasn't where I was at that particular moment."

I now use a Widget called iPhotoMini. Works great. Makes JPGs.

Alternately, you can make PDF screen shots by:

Command (Apple) + Shift + 3
 Captures entire screen

Command (Apple) + Shift + 4
 Gives you Crosshairs, then you click and drag and let go, enabling you to customize your crop

Command (Apple) + Shift + 4, them Spacebar
 You first get a camera icon; after pressing the space bar you can take a picture of any open window.

If you have Tiger, a cool Dashboard widget for this was just released:
